Lab Experiments.

Hands on UI/UX Experiments

1. Explore the fundamentals of UI and UX
2. Differentiate Between UI and UX using real-world case studies
3. Illustrate the relationship between UI and UX in Design
4. Demonstrate various UI/UX Design Tools in Detail

1. Explore the fundamentals of UI & UX

i) what is UI : user Interface (UI) refers to the design of visual elements of a product. including button colors icons and layout It focuses on aesthetics and easy interactive interfaces.

(ii) what is UX : user Experience (UX) involves the overall interaction a user has with the product It focuses on the satisfaction of the user and aim to make the experience seamless.

2. Differentiate Between UI and UX using real case studies

For the real world comparision between UI and UX .Let us compare Facebook UI/UX and Twitter UI/UX

i) Face book's UI & UX

* Rice media, profile pictures notification icons and too many navigation options

* For UX, feature-packed but sometimes over whelming and hard to find settings.

ii) Twitter's UI & UX

* UI : Minimalistic, clear typography and simple timeline layout

* UX : It provide quick content consumption and easy to reads and smooth scrolling.

Illustrate the Relationship between UI and UX in design:

Generally Both UI and UX are important but a well designed UI can improves but a UX (user experience) At the same time a poor UI (user Interface) can ruin user experience (UX)

for an Example

E-commence checkout process

i) Good UI: Visually good looking checkout page with clear buttons and icons

(ii) Bad UI: poor contrast, making it hard to read payment options.

(iii) Good UX: A smooth user friendly experience process

(iv) Bad UX: complicated form feilds that confuse users.

1. Demonstrating Various UI/UX Design Tools:

There various types of UI /UX Design tools They are

(i) Figma:

* used for wide framing prototyping and collaboration

* user - friendly experience
* cloud - based allow multiple designers to work together

(ii) Sketch: Ideal for vector - based designs and creating high - fidelity interfaces.

(iii) In vision: Excellent for prototyping and collecting feedback directly on the design

(iv) Adobe XD:
Focused on wide foaming prototyping and testing designs with animation features.
